1. Description of the plugin

This plugin is created by Matthieu Totet, who is a long time community member of Gephi (check his Gephi Streamer!)

You can find additional documentation on this plugin on Matthieu's website.

This plugin enables you to:

- Collect tweets in realtime, on the topic you choose
- Get the connections between the users mentionned in these tweets
- Visualize these connections in Gephi, or just export all the tweets to Excel

2. Installing the plugin

The setup of the plugin will need you to create a Twitter account, if you don't already have one. Get your Twitter login and password ready. You also need a mobile phone number where your Twitter account can be confirmed.

Setting up a Twitter account and creating a Twitter app is a boring task. It takes just 15 minutes, and you have to do it just once. Then you'll have Twitter at your fingertips.

Let's go!

Figure 9. Choose a username

The next screens of the sign up for Twitter are not important for us. Just follow the steps until you get to the page showing your Twitter profile, meaning the setup is finished.

You now have a Twitter account. We need to create a Twitter app which will authorize us to collect tweets automatically via Gephi

b. Creating a Twitter app

Go to https://apps.twiter.com:

Figure 15. Where to copy paste the codes in Gephi

Done!

Well done. This setup had just to be done once. Your credentials are saved and will be loaded at each run. Now we can start using the plugin.

3. Using the plugin

With the **Words to follow** tab, you will be able to follow one or multiple words. For **hashtags**, just enter the word without the hash in front of it. (e.g if you want to follow '**#Gephi**' just add '**Gephi**')

With the **Users to follow** tab, you will be able to follow the activity of one or multiple users. Any tweet from this user or retweeting or mentioning the user will be captured. You can also import all users from a twitter list by giving the user name of the twitter account and the list name to import.

Add		
Add From List	User : gephi	List Name : gephi-team
Delete	Screen Name	Id
	eduramiba	80533749
	fingr	14322017
	mentatseb	23779644
	apanisson	156031097
	heldersuzuki	47528614
	mathieubastian	22749476
	jersub	40918535

Figure 16. How to add user from a Twitter List

With the **Locations to follow** tab, you will be able to follow the activity of one or multiple locations. Any tweet that has been geotagged will be captured. You need to delimit the zone to track by its South West Point and the Nord East Point.

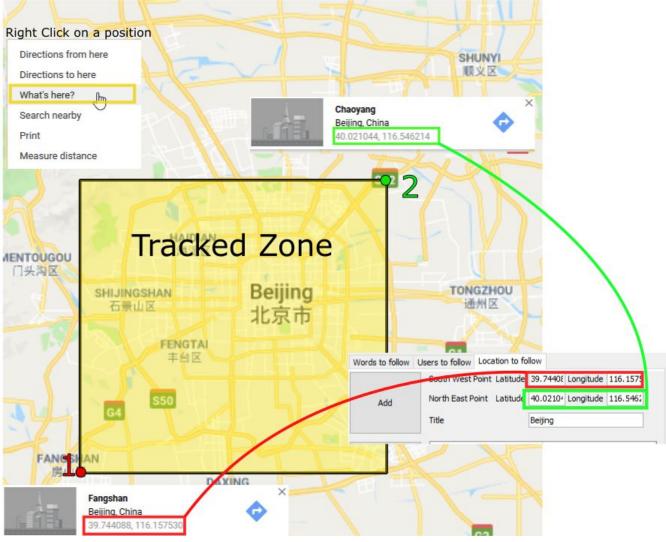

Figure 17. How to add a Locations

You can combine the 2 tabs, the tweet collected will be matching either the Words to follow query **or** the User to follow query

The **Load Query File** and **Save Query File** buttons are here to save your search queries in a file or to load it from a file. It's convenient if you have a long list of words / users.

a. Network Logic

A **Network Logic** means: what should be done with an incoming tweet? How to transform it as a set of nodes and edges?

Layout Twitter Streaming Importer #	
1 - Set Credentials : Credentials	
2 - Define the query :	
Load Query File Save Query File	
Words to follow Users to follow	
Add	
Delete	
3 - Choose Network Logic to apply : Full Twitter Network	
Connect	

Figure 18. Selection of the network logic

There are for the moment 4 Network Logics to choose from:

- Full Twitter Network : This will represent **all** entities (User, Tweet, Hastags, URL, Media, Symbol etc...) as a graph.
- User Network : This will represent the interaction between users. Any mentions, retweets or quotes between 2 users, will be represented. The size of the edge represent the number of interactions between 2 users.
- Hashtag Network : This will create the network of Hashtags.
- Emoji Network : Same as Hashtag Network but focused on Emoji characters (original idea from Neel Shivdasani / @DataNeel).

Note for the Emoji Network : By default, the Label of Emoji nodes use the UTF-8 character representation. On the Overview and the Previsualisation panel, the lable display might not work with the default settings (you will see some square instead). To make it work, you need to use a font that support emoji. The **Segoe Emoji** font should be the one available by default on Win 10.

For the moment, you **won't** be able to export the graph as **SVG** if you keep the UTF-8 character (PNG still works). But you can use the other emoji representation (html or alias) as label to export as SVG and apply post processing on it.

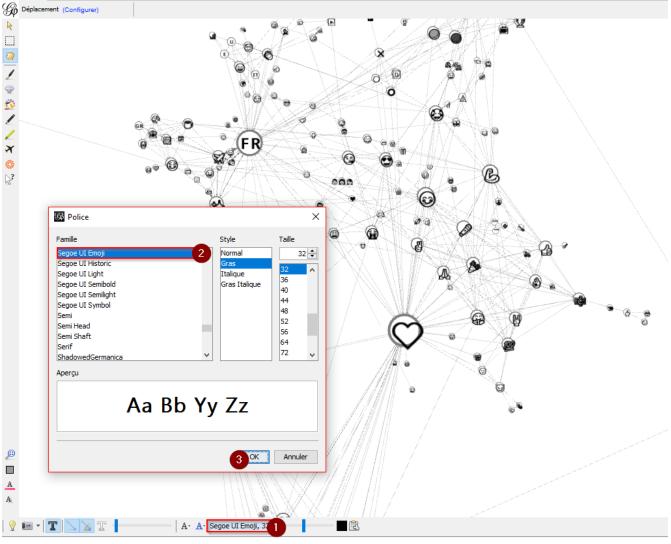

Figure 19. Change font for Emoji display

In the following, we use the network logic "User Network":

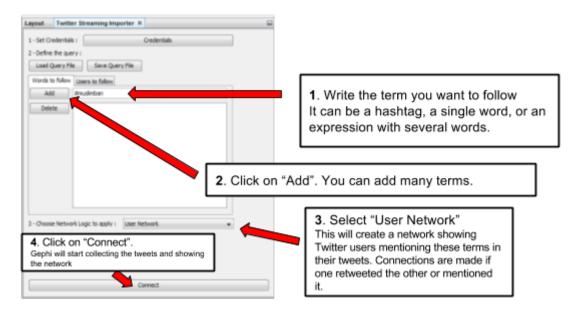

Figure 20. Adding terms and launching the collection of tweets

Be careful that if you choose very common terms, tweets will arrive fast and in large volumes.

If you don't have enough memory (RAM) on your computer, this could make it crash.

Click on "disconnect" to stop the collection of tweets.

Figure 21. Users mentioned in or retweeting tweets citing the search terms

b. Applying a layout while the tweets arrive.

You can see the users organize spatially in real time, while the tweets are being collected.

Just run Force Atlas 2 in the "Layout" panel. This will not interrupt the collection of tweets.

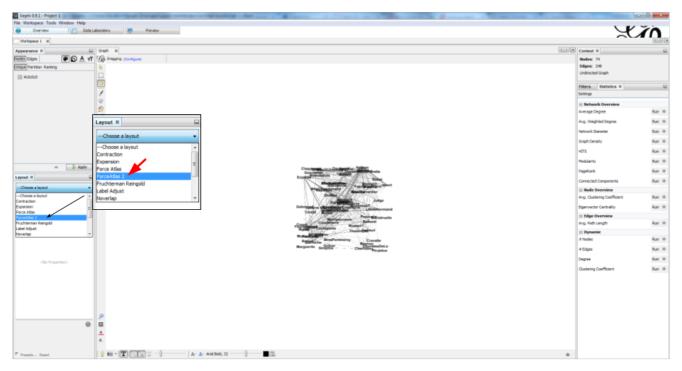

Figure 22. Running the Force Atlas layout while the tweets are arriving

Shift to the data laboratory to view the data collected, in a spreadsheet format:

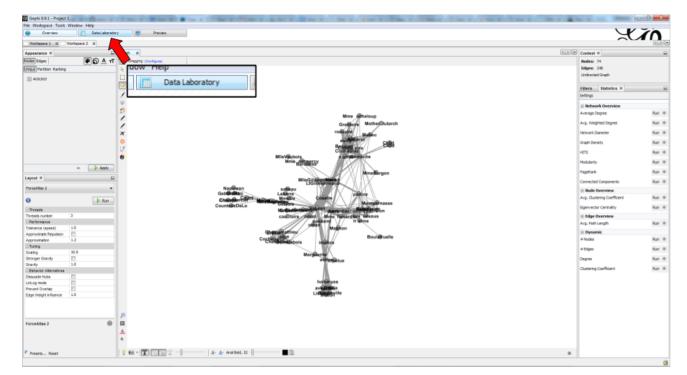

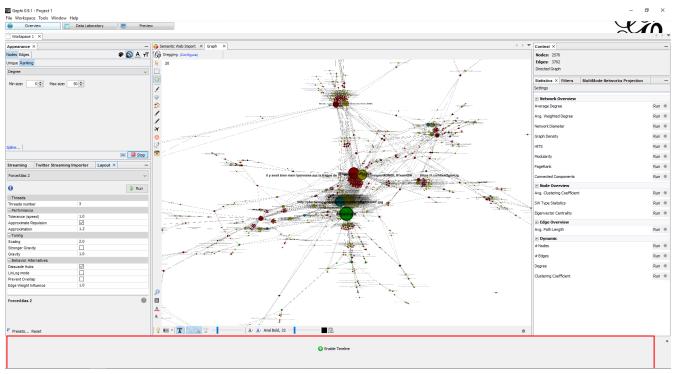

Figure 23. Switching to the data laboratory view

There, you can export nodes and relations ("edges") as csv files by clicking on "Export table".

c. Timeline

When you are finished with your stream, you can use the **timeline** feature to replay the stream of data and look at a particular time window.

This feature is still experimental and is higly subject to bug.

Figure 24. How to activate the Timeline

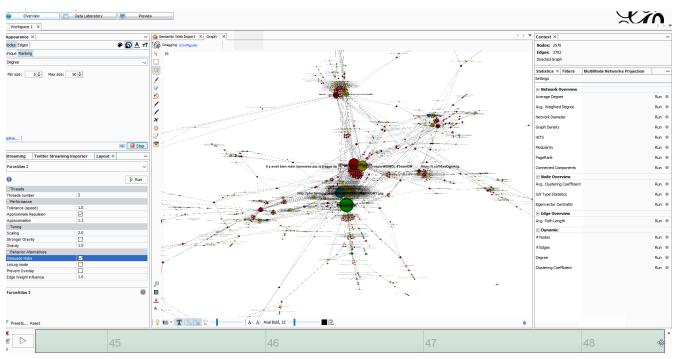

Figure 25. Example of Timeline

The end
